LONG-FORM RESEARCH · THE YEAR IN CHARTS

The Charts That Explain 2026

An oil shock bigger than 1973, inflation back near 4%, central banks hiking again, a trillion-dollar AI build-out funded increasingly with debt, a crypto bear market capped by the largest theft in history, Japan exiting deflation and America decoupling from China. This long-form report tells the story of the markets in 2026 in twelve chapters, each built around the charts that matter, for investors who want the big picture in one place.

Global Markets Research · Global Markets Research Desk Prepared by ANDRA MARKETS

~$100

12 stories, one year

Coverage summary. Two forces shaped 2026. The first was the war in the Gulf: the closure of the Strait of Hormuz on 28 February caused the largest oil supply disruption in history, pushed Brent above $100 and US inflation back to about 4%, and ended the rate-cutting cycle. The second was artificial intelligence: the largest technology companies committed about $730 billion to capital spending this year, more than their operating cash flow at several of them, and markets began to ask who would pay. The result was a market of extremes: energy stocks up more than 50% and records in the S&P 500, alongside negative free cash flow at Alphabet and Amazon, distressed bonds at AI cloud providers, gold falling during a war, Bitcoin down more than a third from its peak and the first Japanese inflation victory in a generation. Each chapter below starts with the key chart, explains why it matters and lists what to watch.

a year of extremes

BRENT, SPOT	US CPI	HYPERSCALER CAPEX 2026	BITCOIN
$123	**3.7%**	**~$730B**	**~$77k**
from $71 before the war	*Sep; ~4.3% peak in May*	*x3 in two years*	*−38% from the Oct 2025 peak*

Exhibit A. 2026 in twelve numbers

#	Chapter	The number	Context
1	The oil shock	10.1 mb/d	largest supply loss on record
2	Inflation is back	3.7%	US CPI, September; euro area 3.8%
3	Central banks turn	0 of 5	major central banks cutting
4	Bonds vs gold	5.31% / $3,885	10-year peak; gold at year low
5	The AI capex boom	~$730B	2026 hyperscaler capex
6	The cash crunch	−$42B	Amazon trailing free cash flow
7	Chips split	−29%	Intel in one day; Nvidia guides $108B
8	AI credit	~16%	CoreWeave bond yields
9	Crypto’s bad year	$6.3B	Binance theft
10	Japan hits 2%	1.25%	BoJ rate; target reached
11	US-China	9%	China’s share of US imports
12	The consumer	48.0	Michigan sentiment

Sources: chapters below.

Exhibit B. 2026 month by month

Month	What happened
January	gold heads to a record; Fed on hold; Bitcoin falling
February	US and Israeli strikes on Iran (28 Feb); Hormuz closes; gold averages ~$5,000
March	Qatar halts LNG; IEA 400m-barrel release; world oil output −10.1 mb/d; TTF +60%
April	Brent closes at $118 (29 Apr); US inflation rising
May	US CPI ~4.3%; gasoline $4.56; Michigan sentiment record low 44.8; Trump visits Beijing
June	ECB hikes; Islamabad Memorandum partially reopens Hormuz; Bitcoin low ~$58,500
July	truce collapses (8 Jul); yen near 164; Section 301 tariffs replace Section 122
August	Nvidia guides $108B; CoreWeave backlog $104B
September	Fed hikes (16 Sep); ECB hikes; BoJ hikes to 1.25%; 10-year +54bp; Xi in Washington
October	10-year 5.31% (5 Oct); TTF €100; hyperscalers report; Intel −29%; Binance $6.3B theft; BoJ declares 2% reached

Sources: Andra Markets reports 2026-62 to 2026-83 and the sources cited there.

1.0 The Oil Shock

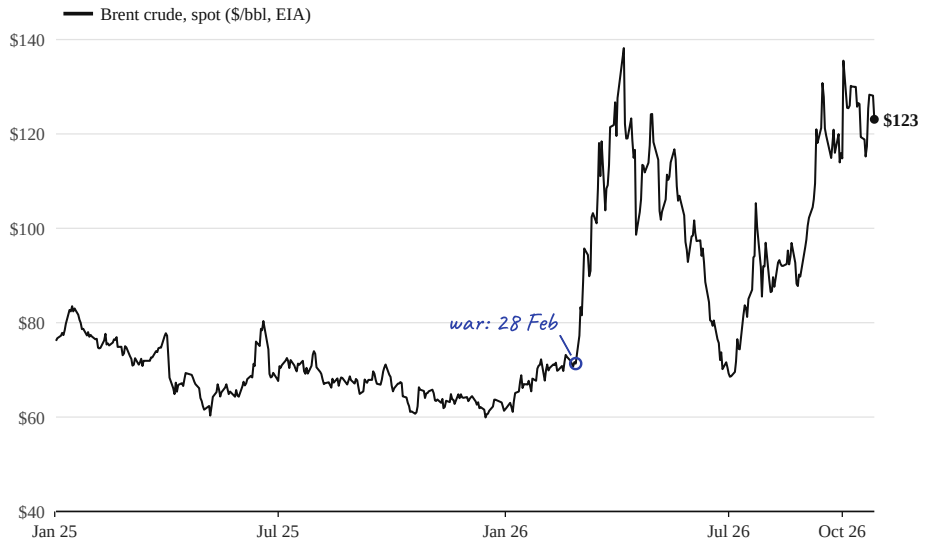

The largest supply disruption in history

~10M

The US and Israeli strikes on Iran on 28 February closed the Strait of Hormuz, through which about a fifth of the world's oil normally flows. The IEA estimates that world output fell by 10.1 million barrels a day in March, twice the loss of any previous shock. Brent spot rose from about $71 before the war to above $120 at its peak and has spent most of the autumn above $100.

x2 any precedent

Exhibit 1. Brent crude oil, spot, since January 2025 ($ per barrel)

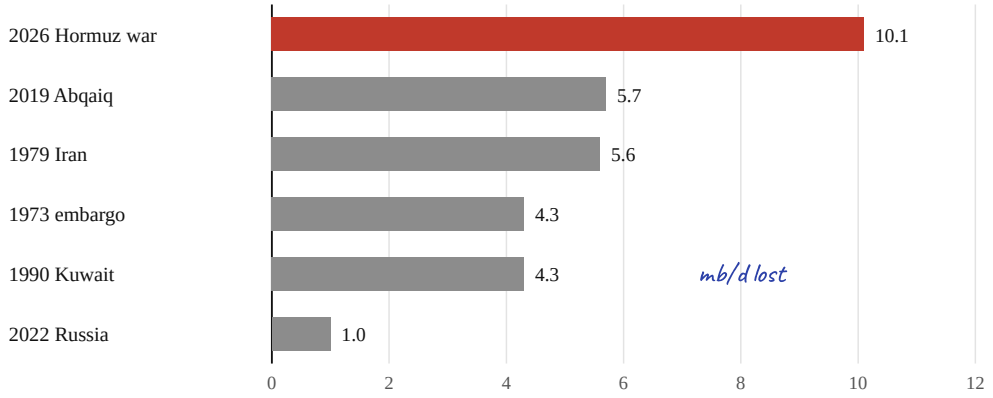

+$40 a barrel

Source: EIA daily spot prices to 27 October 2026.

~400M

Prices rose less than the volume lost suggests, because the IEA released 400 million barrels of emergency stocks, Saudi Arabia and the UAE rerouted crude through bypass pipelines and high prices destroyed demand. Global inventories have fallen 509 million barrels since February and spare capacity is almost nil, so the market has little left to absorb a second disruption. Refined products are tighter still: US diesel set a record of $6.53 a gallon.

Exhibit 2. Peak supply losses in major oil shocks (million barrels a day)

Sources: IEA via globaloilshock.com; Andra Markets 2026-66 and 2026-83.

why it matters

Why it matters. Oil is the common thread of the year. It drove inflation, ended the rate-cutting cycle, transferred income from importers such as India and Japan to producers such as Norway and US energy companies, and pushed Exxon and Chevron to record highs.

What to watch. tanker traffic through Hormuz, Saudi export volumes, OPEC+ decisions and any ceasefire talks; the November IEA Oil Market Report.

watch

Exhibit C. Chapter 1: key numbers

Indicator	Value	Context
Brent, pre-war	~$71	27 Feb 2026
Brent spot, late Oct	~$123	EIA, 27 Oct
Supply lost, March	10.1 mb/d	IEA
Global stock draw	−509m bbl	since Feb
US diesel record	$6.53/gal	AAA

Sources as in the chapter.

2.0 Inflation Is Back

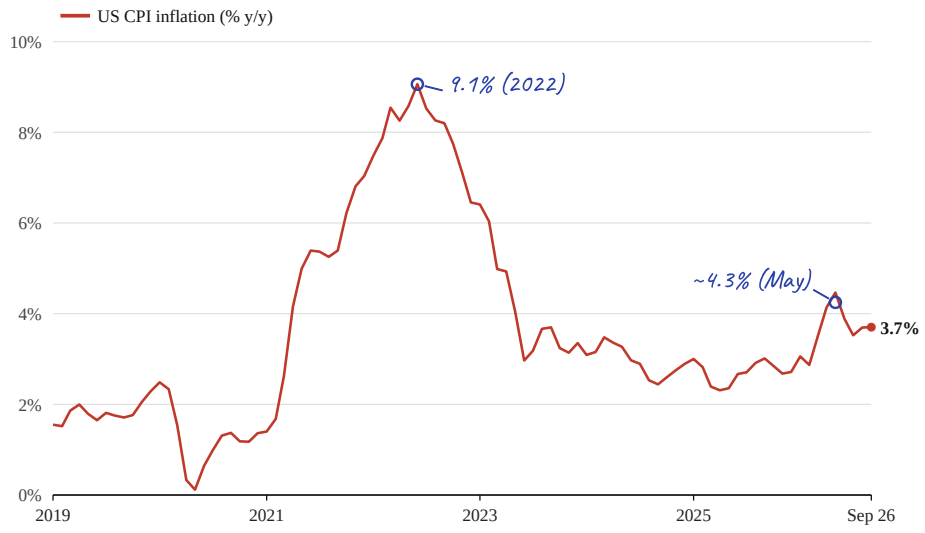

The second wave

~2.4%

US consumer price inflation, which had fallen to about 2.4% in early 2026, rose to roughly 4.3% in May as energy prices surged and stood at 3.7% in September, with energy up about 20%. The Fed's preferred PCE measure reached 3.6%. Euro-area inflation hit 3.8%, Spain 4.9% and the UK 3.5%; Japan's core inflation rose above 2%.

peak ~4.3%

Exhibit 3. US CPI inflation since 2019 (% year on year)

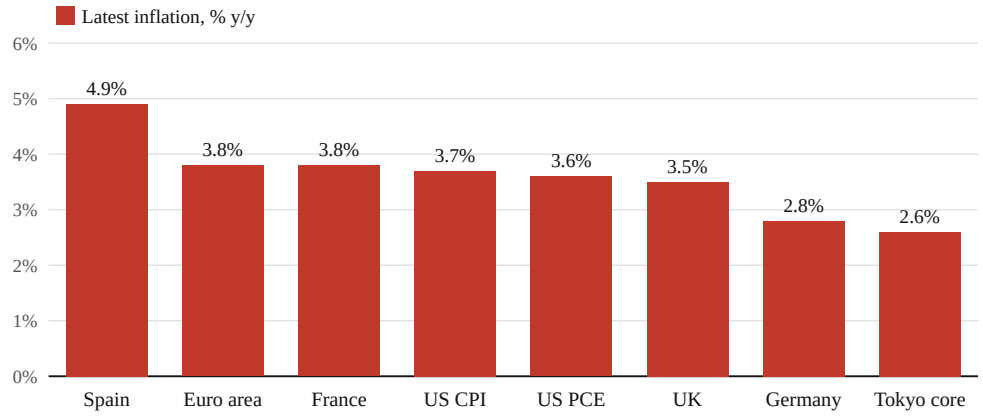

energy-led

Sources: BLS CPI-U via public dataset; September from BLS.

~3.1%

Unlike 2021-22, this wave is driven by energy rather than by demand, and core measures have risen less: US core PCE is 3.1% and euro-area core 2.5%. That distinction is the central bankers' main argument for patience, and their main worry if it starts to fade. Real wages in the US are falling again, with average hourly earnings up 3.0% against 3.7% inflation.

Exhibit 4. Inflation across economies, latest (% year on year)

Sources: national statistics offices via Andra Markets 2026-76.

why it matters

Why it matters. Inflation decides interest rates, and interest rates decide valuations. A second inflation wave within five years makes central banks less tolerant and investors more sensitive to every data release.

What to watch. core inflation and wages for second-round effects; US October CPI in mid-November; euro-area flash HICP on 4 November. watch

Exhibit D. Chapter 2: key numbers

Indicator	Value	Context
US CPI	3.7%	Sep; ~4.3% May peak
US PCE / core	3.6% / 3.1%	Sep
Euro area HICP	3.8%	energy +18.8%
Spain HICP	4.9%	Oct flash
US real hourly pay	~−0.7%	Andra calc.

Sources as in the chapter.

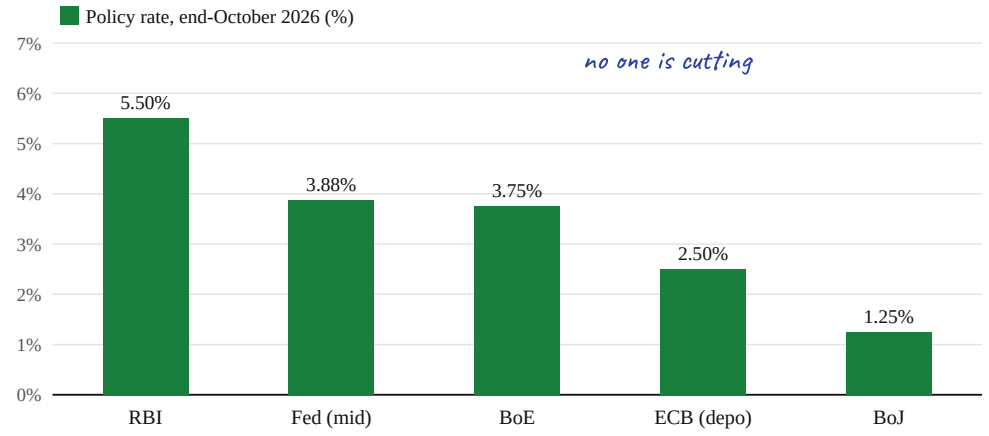

3.0 Central Banks Turn

The end of the cutting cycle

~3.8%

No major central bank is cutting rates. The Fed raised rates in September for the first time since 2023 and held at 3.75% to 4% in October with two members voting for another hike. The ECB raised rates in June and September and held at 2.5%; Christine Lagarde will leave early, in February 2027. The Bank of England is expected to hike on 5 November and the RBI raised rates to defend the rupee. no cuts

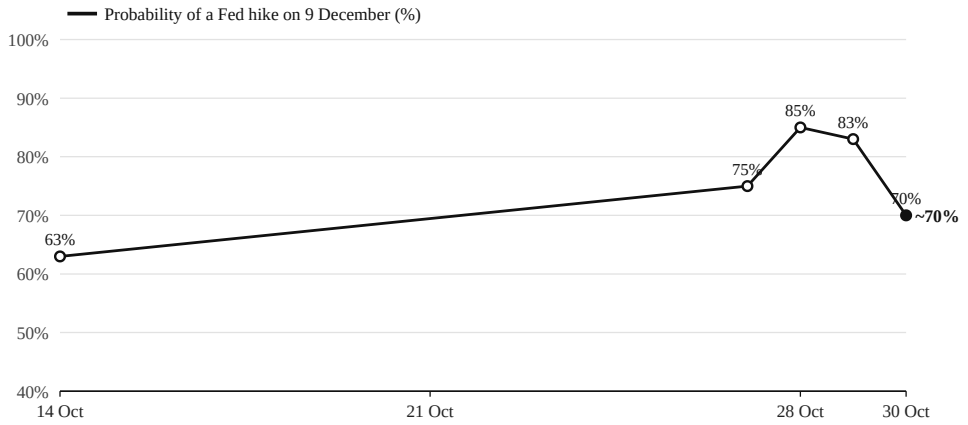

Exhibit 5. Policy rates, end of October 2026 (%)

Sources: Federal Reserve (midpoint); ECB; Bank of England; Bank of Japan; RBI.

Markets now expect the Fed to hike again on 9 December: the implied probability rose from about 42% a month ago to as much as 85% after the October meeting, and stood around 70% to 76% after the September PCE data. Three Fed officials said on 30 October that rates need to be higher, and Dallas Fed president Lorie Logan argued for at least 50 basis points more.

Exhibit 6. Market-implied probability of a Fed hike on 9 December (%)

Sources: CME FedWatch as reported by Forbes, Kiplinger, CNN, FXStreet, CNBC and FatTail.

Why it matters. Higher policy rates raise the cost of borrowing for companies, households and governments, and lift the yield on cash. They also make it harder to justify high valuations for long-duration growth stocks.

What to watch. US jobs report on 6 November; Bank of England on 5 November; Fed on 9 December; the choice of Lagarde's successor.

Exhibit E. Chapter 3: key numbers

Indicator	Value	Context
Fed funds	3.75-4.00%	held 10-2
Dec hike odds	~70-76%	CME FedWatch
ECB deposit rate	2.50%	after June, Sep hikes
BoE Bank Rate	3.75%	hike expected 5 Nov
RBI repo	5.50%	first hike in ~4 yrs

Sources as in the chapter.

4.0 Bonds and Gold Diverge

Safe havens stop agreeing

~5.3%

The ten-year Treasury yield rose about 54 basis points in September and reached 5.31% on 5 October, its highest since 2002, before falling to 4.93% by the end of October. Gold, which hit a record near $5,000 an ounce in the first quarter, fell below $3,900 on 30 October, its lowest level of the year.

5.31%

Exhibit 7. US 10-year Treasury yield since 2000 (%)

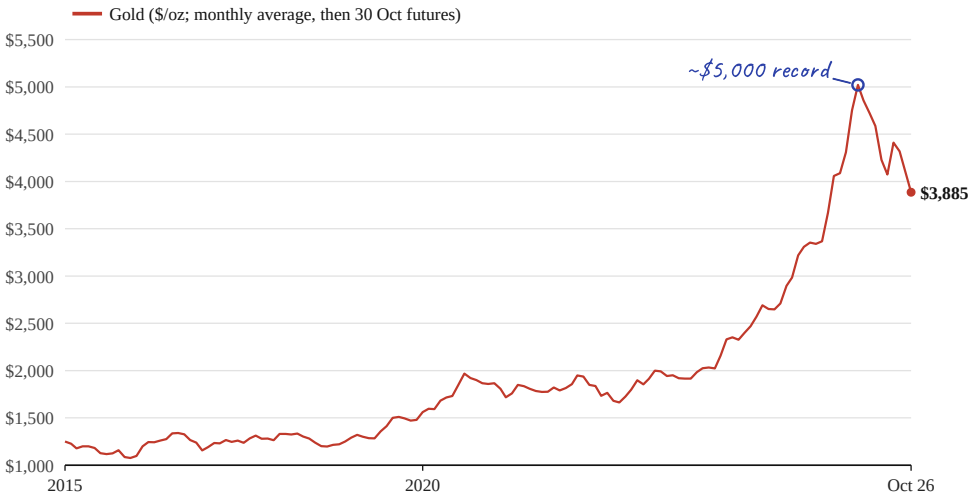

~$1,100 from the top

Sources: Federal Reserve via public dataset; Stock Market Watch; Forbes Advisor.

~2.7%

The two moves share a cause: real yields. FatTail estimates that real yields explain about 91 of the 101 basis points the ten-year rose since February, and the ten-year TIPS yield reached 2.67%. Gold pays no interest, so higher real yields raise the cost of holding it. That is why the traditional inflation hedge fell during a war and an inflation shock.

Exhibit 8. Gold since 2015 ($ per ounce)

Sources: public gold-price dataset (monthly averages); Investing.com (30 October futures).

why it matters

Why it matters. For investors, 2026 is a reminder that bonds and gold protect against different risks. Gold protects when central banks fall behind inflation; in 2026 they are fighting it.

~$4k

What to watch. real yields, the December Fed decision and Treasury buybacks of long-dated debt; gold support near $3,886.

watch

Exhibit F. Chapter 4: key numbers

Indicator	Value	Context
10-year peak	5.31%	5 Oct; since 2002
10-year, 30 Oct	4.93%	−36bp in Oct
10-year TIPS	2.67%	28 Oct
Gold record	~$5,000	Q1 2026
Gold, 30 Oct	$3,885	year low

Sources as in the chapter.

5.0 The AI Capex Boom

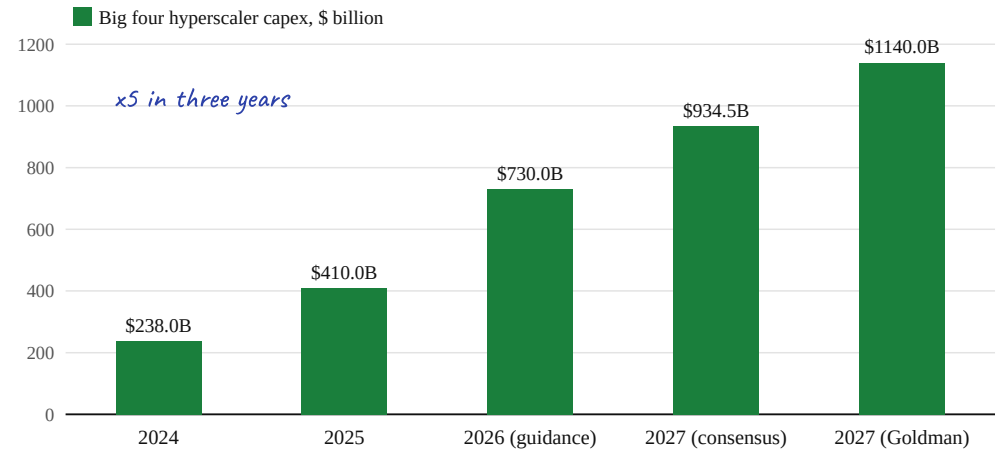

From $240 billion to a trillion

~$238B

The four largest hyperscalers spent about $238 billion on capital expenditure in 2024 and $410 billion in 2025. Their guidance for 2026 adds up to roughly $730 billion, and consensus for 2027 is about $935 billion; Goldman Sachs puts it at $1.14 trillion. Alphabet's quarterly capex tripled in 18 months to $51.4 billion.

~$730B

Exhibit 9. Big four hyperscaler capital expenditure ($ billion)

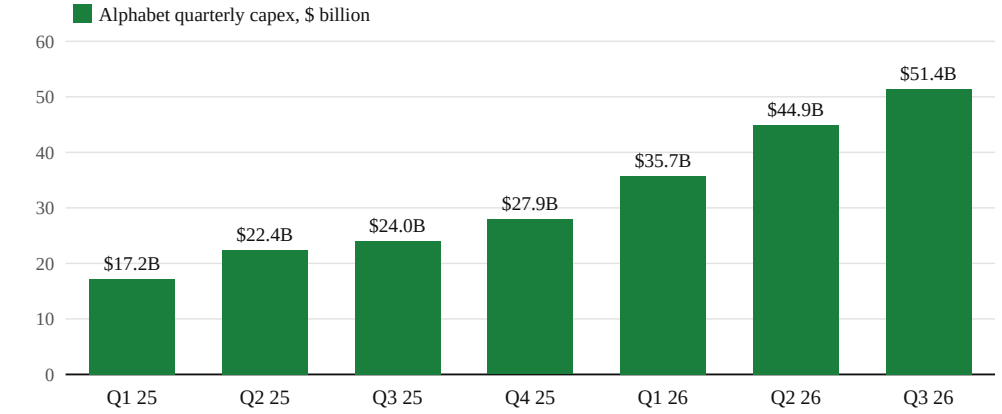

Sources: Forbes, ValueAdd VC, FactSet via IO Fund, Goldman Sachs; Andra Markets 2026-73.

~103%

The demand is real: Google Cloud grew 103% in the third quarter, Azure 48% and AWS 39%, and contracted backlogs exceed $1.7 trillion across the three. Roughly three quarters of the spending goes to short-lived assets such as GPUs, which will be depreciated over five to six years.

Exhibit 10. Alphabet quarterly capital expenditure ($ billion)

Source: Alphabet earnings releases.

why it matters

Why it matters. The AI build-out is the largest private investment cycle in decades. It drives Nvidia's revenue, power demand and much of the S&P 500's earnings growth, and it is now large enough to move credit markets.

What to watch. 2027 capex guidance in late January; cloud growth and backlog conversion; depreciation as a share of revenue.

Exhibit G. Chapter 5: key numbers

Indicator	Value	Context
2026 capex (big four)	~$730B	guidance
2027 consensus	~$935B	FactSet
Google Cloud growth	+103%	Q3
Azure / AWS growth	+48% / +39%	Q3
Contracted backlog	~$1.7T	3 companies

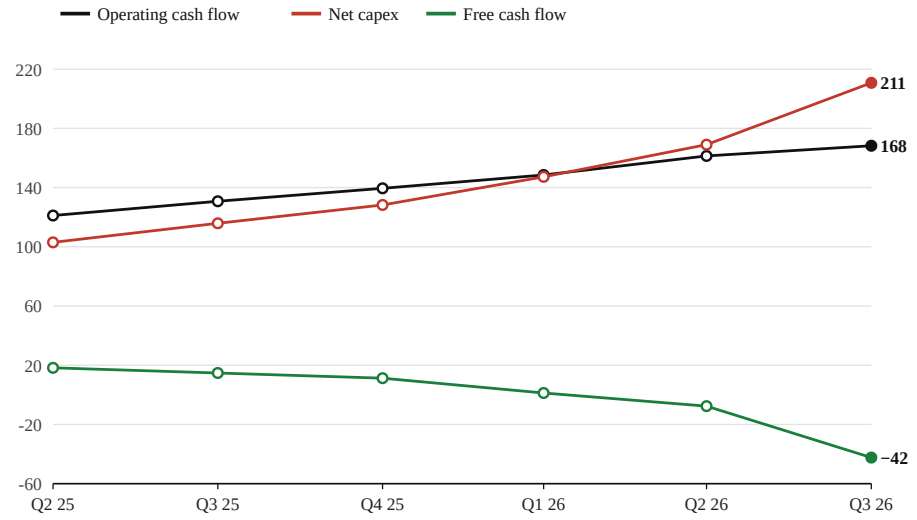

Sources as in the chapter.

6.0 The Cash Flow Crunch

When spending outruns cash

In the third quarter, capital spending exceeded operating cash flow at Alphabet and Amazon for the first time in this cycle. Amazon's trailing free cash flow swung from +$18 billion in mid-2025 to −$42 billion; Alphabet reported negative free cash flow of $9.1 billion. Only Microsoft covered its capex from operating cash flow.

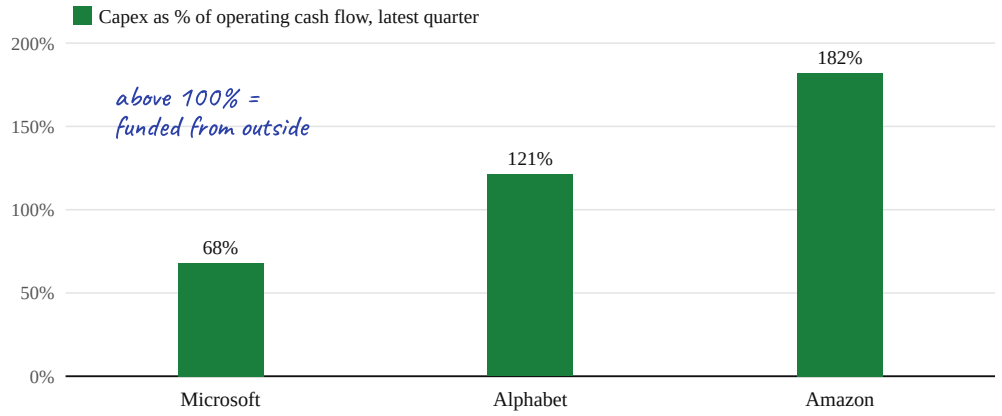

Exhibit 11. Amazon trailing-twelve-month cash flows ($ billion)

Source: Amazon Q3 2026 earnings release.

The gap is being filled with debt and equity. Alphabet raised about $85 billion of debt, $43 billion of common equity and $19 billion of preferred stock in nine months and suspended buybacks; Amazon's long-term debt rose from $66 billion to $173 billion. The market punished both after their results and rewarded Microsoft.

Exhibit 12. Capex as a share of operating cash flow, latest quarter (%)

Sources: company cash flow statements; Andra Markets calculations.

why it matters

Why it matters. Per-share returns depend on cash, not on growth alone. Funding capex with new shares dilutes existing holders and funding it with debt adds interest costs, which is why the market now judges hyperscalers on cash coverage.

What to watch. free cash flow at each company, bond issuance, buyback policy and any dates given for a return to positive cash flow.

watch

Exhibit H. Chapter 6: key numbers

Indicator	Value	Context
Amazon FCF, TTM	−$42.4B	Q3
Alphabet FCF, Q3	−$9.1B	2nd negative qtr
Microsoft FCF, Q3	+$18.6B	covered capex
Alphabet debt raised, 9M	$85.2B	plus $62B equity
Amazon LT debt	$173B	from $66B

Sources as in the chapter.

7.0 The Chip Market Splits

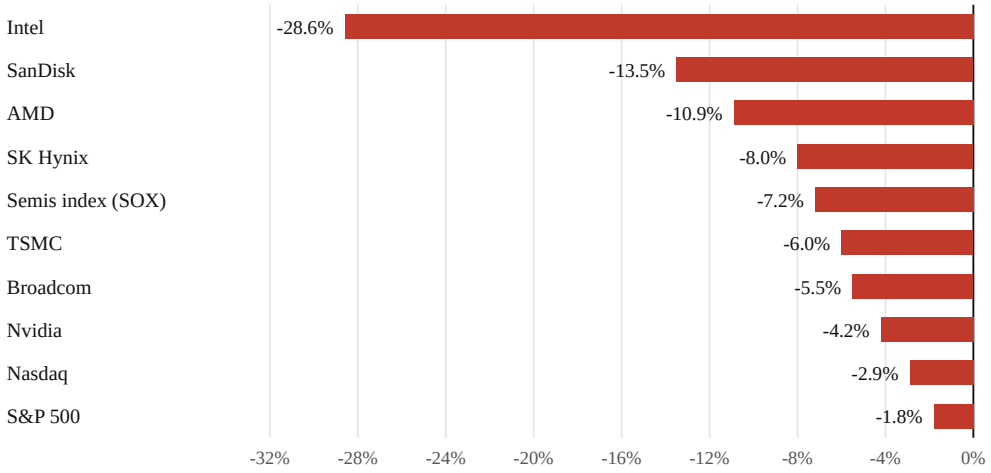

AI winners, everyone else

~29%

On 30 October Intel fell 29% after guiding fourth-quarter revenue and margins below expectations, despite data-centre revenue growth of 78%. The semiconductor index fell 7.2% and the Nasdaq 2.9%, its worst day since June. AI absorbs supply, capital and memory pricing, squeezing PC and phone chips.

$108B

Exhibit 13. Price change on 30 October 2026 (%)

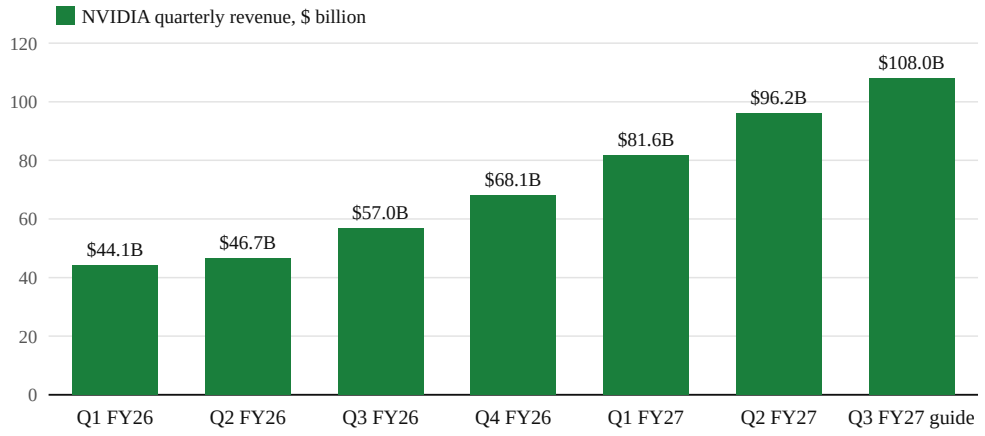

guide ↓

Sources: Seoul Economic Daily; Fool.com; StockTitan; approximate closes.

~$108B

At the top of the chain the numbers keep rising: Nvidia guided its fiscal third-quarter revenue to $108 billion, more than double a year earlier, and reports on 17 November. Its market value slipped below $5 trillion on Friday, ceding first place to Apple, a sign that even the AI leader is no longer immune to doubts about who pays for the build-out.

Exhibit 14. NVIDIA quarterly revenue ($ billion)

Source: NVIDIA 8-K releases; Q3 FY27 is guidance.

why it matters

Why it matters. The AI cycle is narrowing the winners. Breadth matters for the index: a market led by a handful of companies is more vulnerable to disappointments at any one of them.

What to watch. Nvidia's Q4 guide on 17 November; PC and memory pricing; Intel's supply constraints. watch

Exhibit I. Chapter 7: key numbers

Indicator	Value	Context
Intel, 30 Oct	−28.6%	to $65.76
SOX, 30 Oct	−7.2%	worst since June
Intel Q4 guide	$15.5B	vs ~$17.1B
Nvidia Q3 guide	$108B	reports 17 Nov
Nvidia mkt value	<$5T	Apple No. 1

Sources as in the chapter.

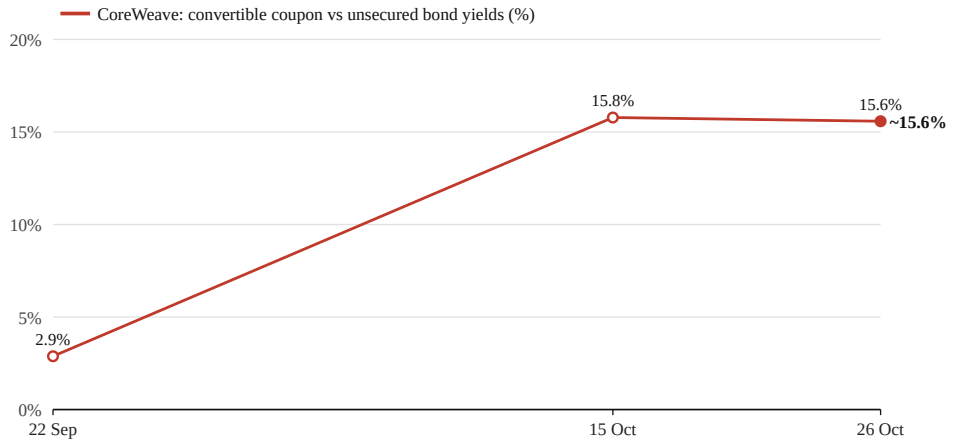

8.0 Credit for AI

The neocloud squeeze

~16%

The specialised cloud providers that rent GPUs to AI labs lost a third of their market value in a month. CoreWeave's unsecured bonds yield about 16% and its credit default swaps trade above 1,100 basis points; it sold convertibles at 2.875% in September. CoreWeave, Nebius and Nscale have been reported to be effectively shut out of new bond issuance. debt-funded

Exhibit 15. CoreWeave: from cheap convertible to distressed yields (%)

Sources: CoreWeave; BigGo Finance; RoboForex.

These companies borrow against GPUs and customer contracts. CoreWeave has $35.6 billion of debt against $5.5 billion of cash and plans $35 to 39 billion of capex this year, about three times its revenue. NVIDIA has invested more than $7 billion in AI clouds and shows up to $164.5 billion of related guarantees and commitments.

Exhibit 16. Debt and cash, 30 June 2026 ($ billion)

Sources: company filings via 24/7 Wall St. and Yahoo Finance.

Why it matters. Credit is where an investment boom meets its cost of capital. The neocloud squeeze shows that lenders will fund AI only at higher prices and for stronger balance sheets.

What to watch. neocloud Q3 results in November, CoreWeave bond yields, GPU rental prices and any support from suppliers or customers.

Exhibit J. Chapter 8: key numbers

Indicator	Value	Context
CoreWeave bond yield	~15.6%	26 Oct
CoreWeave CDS	1,148bp	26 Oct
CoreWeave debt / cash	$35.6B / $5.5B	30 Jun
AI bonds issued, 2026	$419B	record
Nvidia commitments	up to $164.5B	filing

Sources as in the chapter.

9.0 Crypto's Bad Year

A bear market and a record theft

Bitcoin peaked at about $126,000 in October 2025 and fell to about $58,500 by the end of June 2026 as ETF outflows, higher rates and rotation into AI equities weighed. It recovered to about $81,000 by late October before the Binance theft knocked it back to about $77,000.

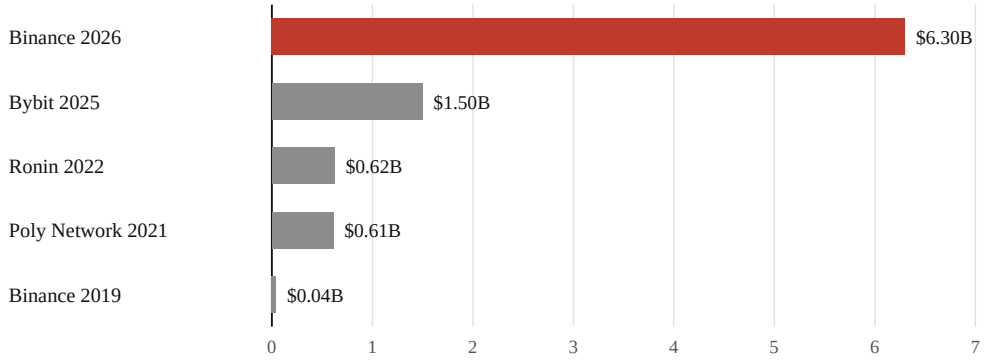

Exhibit 17. Bitcoin since January 2025 ($, daily close)

Source: Bitstamp daily closes.

On 29 October attackers stole about $6.3 billion from Binance's hot wallets across ten blockchains, four times the previous record. Investigators attribute it to North Korea. Binance froze about $3 billion and pledged to cover all losses from $6.34 billion of company funds; liquidations reached $1.57 billion and spot ETFs saw $643 million of outflows.

Exhibit 18. Largest crypto platform thefts ($ billion)

Sources: Binance; TRM Labs; Andra Markets 2026-78.

Why it matters. Crypto in 2026 behaved like a high-beta risk asset, not a hedge, and the Binance theft is a reminder that custody risk sits alongside price risk. Crypto-assets are highly volatile and can lose all their value.

What to watch. the restart of Binance withdrawals, spot ETF flows and recovery of frozen funds.

Exhibit K. Chapter 9: key numbers

Indicator	Value	Context
Bitcoin ATH	~$126k	6 Oct 2025
Bitcoin, 30 Oct	~$77k	6-week low
Binance theft	$6.3B	10 chains
Frozen	~$3B	Tether, Circle, others
Liquidations, 24h	$1.57B	~84% longs

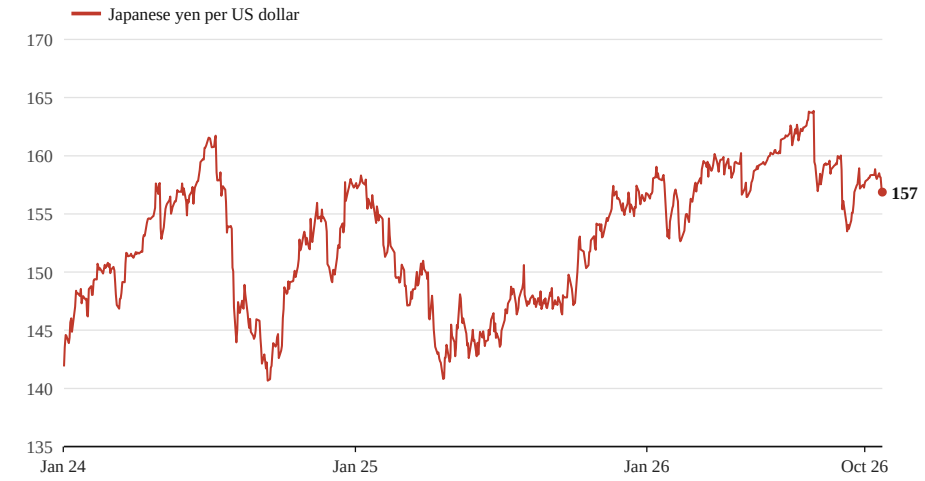

Sources as in the chapter.

10.0 Japan Hits 2%

The end of deflation

On 30 October the Bank of Japan said for the first time since adopting its 2% target in 2013 that underlying inflation is at a level consistent with it. It held its rate at 1.25% after a hike in September, with one member voting for 1.5%, and markets price a December hike at about 68%.

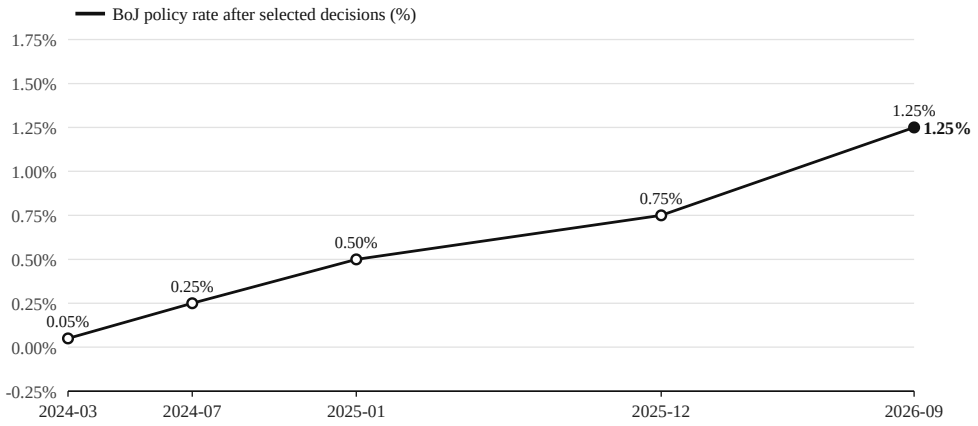

Exhibit 19. Japanese yen per US dollar since January 2024

Source: Federal Reserve H.10 daily exchange rates.

Japan has gone from negative rates to 1.25% in 30 months. The ten-year JGB yield reached 3.05% in September, its highest since 1996. The yen has not strengthened much, because US rates rose faster, and traded near 164 per dollar in July.

Exhibit 20. Bank of Japan policy rate after selected decisions (%)

Sources: Bank of Japan; CNBC; Jiji Press.

Why it matters. Higher Japanese yields could slowly pull Japanese savings home from foreign bond markets, one of the largest pools of capital in the world.

What to watch. the December BoJ meeting, spring 2027 wage talks and the yen's reaction to US rates.

Exhibit L. Chapter 10: key numbers

Indicator	Value	Context
BoJ rate	1.25%	held 8-1
Core CPI, Sep	2.1%	core-core 2.3%
10-year JGB peak	3.055%	24 Sep; since 1996
Yen	~157	~164 in July
Dec hike odds	~68%	FatTail

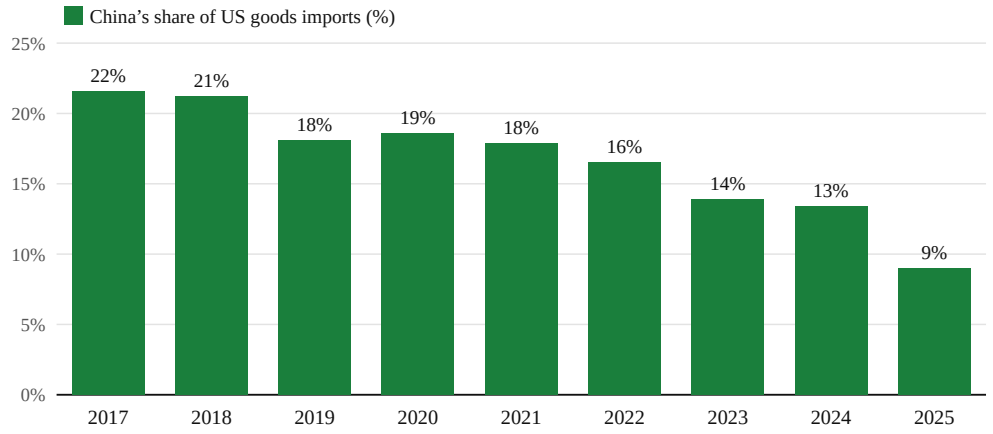

Sources as in the chapter.

11.0 America Decouples from China

With leaks

China's share of US goods imports fell from 21.6% in 2017 to about 9% in 2025, roughly its level when China joined the WTO, and the bilateral deficit fell from $418 billion in 2018 to $202 billion. The effective US tariff on Chinese goods averaged about 24% in 2026, against 6% for other countries.

Exhibit 21. China's share of US goods imports (%)

Sources: US Census Bureau; CRS; Stanford SCCEI.

The truce agreed in Busan in 2025 was extended in September to 10 January 2027, but the legal texts behind it still expire on 9 and 10 November. China reported about $100 billion more exports to the US in January-July than the US recorded as imports, which points to transshipment and under-declaration. The yuan has strengthened from 7.34 to about 6.67 per dollar.

Exhibit 22. Chinese yuan per US dollar since January 2025

Source: Federal Reserve H.10 daily exchange rates.

Why it matters. Trade policy now runs through executive tariffs and export controls on chips and rare earths, where China controls about 90% of processing. A lapse in the truce would hit autos, defence and electronics supply chains first.

What to watch. MOFCOM and Federal Register notices before 9-10 November; rare-earth export data; the 10 January deadline.

Exhibit M. Chapter 11: key numbers

Indicator	Value	Context
China share of US imports	~9%	21.6% in 2017
Deficit with China	$202B	2025; $418B in 2018
Effective tariff on China	~24%	vs 6% others
Missing trade	~$100B	Jan-Jul 2026
Yuan	~6.67	from 7.34

Sources as in the chapter.

12.0 The Consumer at the Limit

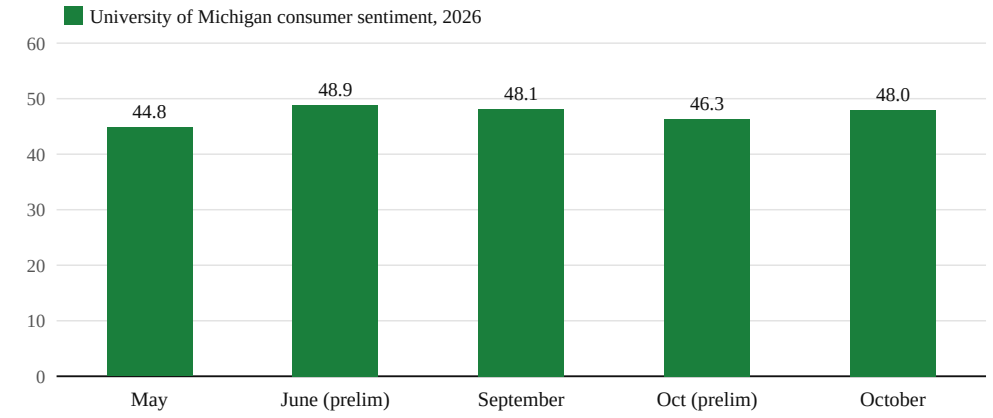

Mood vs spending

~4.7%

The University of Michigan's consumer sentiment index hit a record low of 44.8 in May and was 48.0 in October, the second-lowest on record. One-year inflation expectations are 4.7%, gasoline is above $4 a gallon and payrolls rose only 29,000 in September.

real pay falling

Exhibit 23. University of Michigan consumer sentiment, 2026

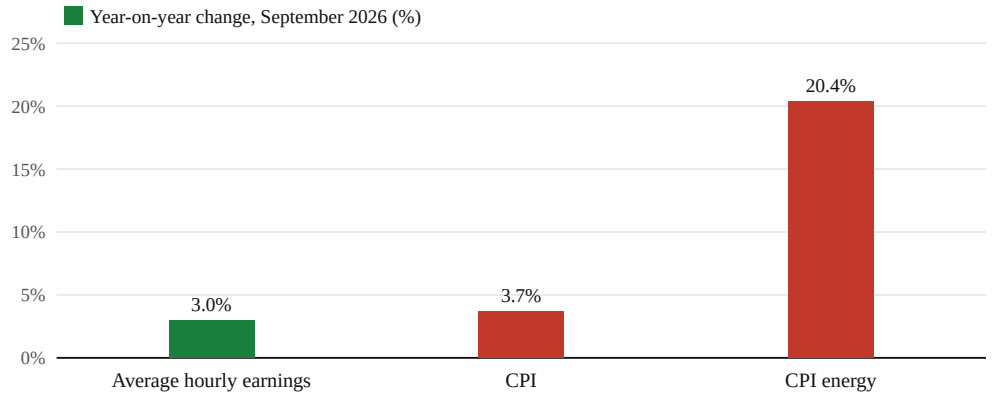

48.0

Source: University of Michigan via TheStreet, Bloomberg and others.

~$1.0T

Spending has held up anyway, carried by higher-income households: the National Retail Federation expects holiday sales to pass $1 trillion for the first time, up 4.2%, about half of it price. Real hourly pay is falling and card balances are near a record $1.28 trillion.

Exhibit 24. Wages vs prices, September 2026 (% year on year)

Sources: BLS; Andra Markets calculations.

why it matters

Why it matters. Consumer spending is about two thirds of the US economy. A split consumer, with lower-income households under pressure, leaves growth exposed to a further oil spike or a turn in the labour market.

What to watch. the 6 November jobs report, Black Friday on 27 November and gasoline prices.

watch

Exhibit N. Chapter 12: key numbers

Indicator	Value	Context
Michigan sentiment	48.0	Oct; 44.8 May low
1-yr inflation expectations	4.7%	Michigan
Payrolls, Sep	+29k	UR 4.2%
NRF holiday forecast	$1.013T	+4.2%
Card balances	$1.263T	Q2

Sources as in the chapter.

12.5 Five Lessons From 2026

Educational, not advice

Growth is not the same as cash. Companies with the fastest revenue growth in the AI build-out were punished when their spending outran their cash flow. Reading the cash flow statement, not only the income statement, explained more of 2026 than any growth rate.

Real interest rates rule. Gold, long-term bonds and expensive growth stocks all moved with real yields. The same inflation shock that hurt bondholders also hurt the traditional inflation hedge, because central banks responded by raising rates.

Shocks travel through the weakest link. In credit, the neoclouds cracked first; in currencies, energy importers; in crypto, a single exchange's hot wallets. Stress usually shows up first where leverage is highest and buffers thinnest.

Concentration cuts both ways. A market led by a handful of AI companies rose to records but fell 2-3% in a day when one of them disappointed. Breadth, the number of stocks participating in a rally, is worth watching.

Diversification still matters. Energy stocks gained more than 50% in a year when technology stumbled, and cash yielded about 4%. No single asset protected investors in every episode of 2026. These lessons describe what happened; they are not recommendations to buy or sell any asset.

13.0 Putting It Together

What links the twelve charts

The twelve stories are connected by a single variable: the cost of money. The oil shock lifted inflation; inflation ended the rate-cutting cycle; higher real yields pushed bond yields to two-decade highs and gold lower; higher yields raised the bar for AI spending just as the hyperscalers moved from funding it with cash to funding it with debt and equity; credit markets repriced the weakest borrowers first, from neoclouds to crypto; and the consumer felt it through fuel prices and borrowing costs. 2026 is the year the market rediscovered that capital is not free. Whether 2027 brings relief depends mainly on two things: a reopening of Hormuz, and evidence that the AI build-out produces cash, not only revenue.

Exhibit O. Andra Markets scenarios for 2027

Scenario	Prob.	Oil	Rates	AI and equities
Soft landing	40%	Hormuz reopens; Brent $75-90	Fed pauses after one more hike	capex digested; breadth improves
Higher for longer	40%	Brent $95-120	more hikes; 10-year 5-5.5%	multiples compress; cash-rich firms lead
Hard landing	20%	second supply shock or demand collapse	hikes then fast cuts	recession; AI capex cut; credit stress

Andra Markets scenarios; probabilities are judgemental. Not a recommendation on any security.

Exhibit P. Calendar for the rest of 2026

Date	Event	Chapter

This document is produced by Andra Markets Global Markets Research for informational and educational purposes only. It is not investment, legal, accounting or tax advice, and it is not an offer, solicitation or recommendation to buy, sell or hold any security or financial instrument. Figures are drawn from public sources believed to be reliable but are not independently verified. Views are those of the desk at publication and may change without notice. Past performance is not indicative of future results. Andra Markets accepts no liability for any loss arising from the use of this material.

Crypto-asset risk warning. Crypto-assets are highly volatile, largely unregulated outside specific frameworks such as MiCA in the EU, and can lose all their value. Exchange failures and hacks can result in total loss of funds. Nothing in this report is a recommendation to buy, sell or hold any crypto-asset or to use any trading venue.
